## 4. Technology Overview

### 4.1. AMR Technology

IST8310, an iSenteK patented magnetometer is designed based on Anisotropy Magnetoresistance (AMR) technology. The output is generated by the resistance change of the AMR resistors as the external magnetic field varies. The sensitivity is approximately 50 to 200 times greater than conventional Hall elements. The high sensitivity allows a higher output data rate (ODR), lower noise, and lower power consumption.

### 4.2. High Reliability Planarized Structure Design

IST8310 consists of three full Wheatstone Bridges of AMR resistors. The three bridges detecting magnetic components in three orthogonal directions are wire-bonded to a control ASIC on a single chip. This planarized structure design enables outstanding stability to thermal shock, making our device highly reliable, whereas other known AMR magnetometers with z-axis sensors placed vertically on the substrate using 90-degree flip-chip packaging suffer from reliability issues.

### 4.3. Ultra-low Hysteresis Design

iSenteK has developed a specialized high permeability ( $\mu$ ) material for magnetic field detection. This high- $\mu$  material has ultra-low residual magnetization below 0.1 %FS in the field range as large as  $\pm 500$  G. The ultra-low hysteresis design prevents the magnetometer from experiencing dynamic offset after encountering a strong external magnetic field impact; that is, the angular accuracy is restored automatically without calibration after the removal of interference field. This feature fulfills the requirements for applications when real-time calibration is unavailable. No calibration is required in general conditions.

### 4.4. Magnetic Setting Mechanism

AMR sensing resistors consist of permalloy thin film and metallization. Permalloy is a soft magnetic material. Irreversible magnetic rotation may occur when the strength of external magnetic field exceeds half of the anisotropy field of the sensing resistor, resulting in angular error induced by offset. To solve this issue, a magnetic setting mechanism has been introduced in IST8310. A magnetic field is generated within IST8310 to align the magnetization of AMR sensing resistors before every measurement. This auto-zeroing mechanism ensures the stability of IST8310's angular accuracy throughout the operation.
